

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

An account of the Eclipses or ingresses of Jupiters Satellits into his shadow and such Emerfions of them from it as will be visible at the Observatory at Greenwich in the three last Months of this year 1683. sent in a Letter to the Publisher from J. F. Astron. Reg.

S I R,

I Here send you an account of the *Eclipses* or *Ingresses* of *Jupiters Satellits* into his shadow, and such emerfions of them from it as will be visible at the *Observatory* in the three last moneths of this year ; they are calculated from *new Tables* I made this last summer, and I hope so exactly that the *Ingresses* of the first will seldom be found when observed, to differ above 5 minutes from the time stated, the 3 but little more; the *Eclipses* of the fourth and second I dare not promise you shall agree so well, for I find their *motions* evidently intangled with inequalitys, which it will require a long time and many more accurate *observations* to determine and limit, then I have yet obtained : these *Eclipses* have been esteemed, and certainly are a much better expedient for the discovery of the *Longitude* then any yet known, by reason that they happen frequently, and are easily observeable with a *Telescope* of 12. foot, or for need with one of 8. These *Ingresses* (and *emerfions* also if visible) from the time till the oposition of the ☉ and ♃ happen truly on the right hand or in *antecedence* of the *planet*, but if they shall be observed with *Telescopes* of only two *Convex glasses* which invert the object, they appear on the contrary or left side of him. If these find acceptance with our ingenious friends the *Eclipses* of the next year shall be imparted early enough to be published in the *December Transactions*. I am

S I R,

yours, &c.

J. FLAMSTEED.

Observatory Sept. 22. 1683.

The

The Ingresses of Ψ Satellits into his Shadow and Emerfions of the third and fourth from it, visible at the Observatory in the moneths of October November and December, 1683.
